

Dear Art Abraham,

We are delighted to share some exciting news following from a successful clinical trial and study that took place in 2021 around the efficacy of the Pathisol Annihilizer and the methodology of application and training. The trial was centred around using Hypochlorous Acid, produced via our on-site generator and applied using electrostatic equipment to disinfect several NHS Hospital wards which produced positive results. Due to ward occupancy of visitors due to COVID-19 in 2021 a further smaller study is also planned in March 2022 across a few hospital wards to back-up initial study results.

We have been also awarded onto a second National Healthcare framework. The latest being the NHS supply chain (the biggest NHS provider of equipment) and is expected to go live in March 2022. This means our advanced technology is accessible throughout the NHS and to healthcare providers who wish to use the eco-friendly, highly effective cleaning products, all while reducing their carbon footprint.

The white paper that denotes the success of the initial and second trial is planned to be published in the first quarter of this year (2022). This is an incredible opportunity, and we are thrilled with the progress made so far that paves the way for a brighter future for cleanliness and hygiene standards.

Kevin Gray, Tutum Health CEO
